RNA Biology · Method Development · Experimental Ground Truth for AI Models

Email | ORCID | Scholar | LinkedIn | GitHub | Website

Summary

I'm an experimentalist who builds methods and generates data to train AI models. RNA structure and function is my deep specialty, and I work fluently across *in vitro*, microbial, and mammalian systems, from molecular biology and biochemistry to imaging and high-throughput assays.

I design experiments that generate large, structured, analysis-ready datasets, and I run them as a closed loop: give a model a real design problem, build and measure its best candidates at the bench, and feed the results back into the next round. That loop is also how I find where models break. My goal is to develop wet-lab methods that generate reproducible, quantitative, high-throughput data at the speed models need; to use that data to test what those models predict; and to put it back in the hands of the teams building them, so the next model predicts better, and to use those models to engineer the biomolecules and therapeutics of the future.

Research Experience

Postdoctoral Researcher Mar 2025 – Present

Stanford University, Das Lab *California, USA*

- **Invented FAST-MaP**, a rapid, primer-less RNA chemical-mapping pipeline that takes a DNA template to per-nucleotide reactivity in under a week (∼25–30 h hands-on). It runs entirely on commercial gene-synthesis and sequencing services with a public web-based analysis server, requiring no in-house NGS infrastructure and no custom bioinformatics. This makes quantitative RNA structure questions answerable in any lab worldwide (in review).
- **Shared the FAST-MaP protocol with AI@HHMI** collaborators at Janelia, who adopted primer-less sequencing for their initial RNA structure-probing pilots.
- **Closed the experiment-to-model loop for de novo RNA design** (*Science*, 2026): chemical-mapping readouts produced by my method guided successive rounds of AI-designed pseudoknots, feeding structural ground truth back to the computational team between design cycles.
- **Designed tunable mRNA constructs** that repress cap-dependent translation through an engineered long-range interaction within the transcript: ∼8–9-fold repression by NanoLuc reporter assay in HeLa, against ∼1.5-fold for a length- and composition-matched specificity control. No published translation-efficiency model predicts the effect (manuscript in prep).
- **Designed and launched *mRNA Switch Controls***, an Eterna crowdsourcing lab that turns a single working construct into an open design challenge: players design 50-nt 3′ elements that fold back over the start codon of a NanoLuc reporter to switch translation off or on. The pilot round is complete, and the selected designs are now in experimental validation.
- **Validated** `cmuts`, a mutational-profiling pipeline scaling structure profiling beyond the transcriptome, using *in vitro* chemical probing (2A3, DMS).

Postdoctoral Researcher Jan 2024 – Aug 2024

University of British Columbia, Loewen and Roskelley Labs *Vancouver, Canada*

- **Built reproducible quantitative image-analysis pipelines** (segmentation, feature extraction, statistics) for high-throughput cellular phenotyping, turning noisy microscopy into structured, analysis-ready metrics

for quantitative comparison across conditions.

Graduate Research Assistant Sep 2017 – Dec 2023

University of British Columbia, Loewen and Roskelley Labs *Vancouver, Canada*

- **Discovered a conserved role for the PAN deadenylase complex** in maintaining mitotic robustness under microtubule stress, integrating genome-wide genetic screens (∼4,800 strains across two conditions), RNA-seq, live-cell imaging, and siRNA/shRNA knockdown of PAN2 in HEK293A cells to test conservation from yeast to human (in review).
- **Established that Pho85-dependent phosphorylation of Pan3** links cell-cycle signaling to mRNA turnover, applying extensive molecular cloning, mutagenesis, and plasmid construction.
- **Trained and mentored undergraduate researchers** in cloning, yeast genetics, and imaging, supervising their day-to-day experiments.

Graduate Student Researcher Aug 2014 – May 2017

Jawaharlal Nehru Centre for Advanced Scientific Research *Bangalore, India*

- **Identified a role for the autophagy protein Atg11** in chromosome-segregation fidelity using growth-based genetic screens, high-throughput imaging, and transcriptional assays in budding yeast (*PLOS Biology*, 2025).

[**Published**] Townley J.*, Kladwang W.*, … **Verma J.**, … Eterna Participants, Das R. De novo design of RNA pseudoknots with deep learning. *Science* (2026). *equal contribution

[**Published**] Reza M.H., Aggarwal R.*, **Verma J.*** et al. Atg11 is required for high-fidelity chromosome segregation. *PLOS Biology* (2025). *equal contribution

[**In review**] **Verma J.** et al. FAST-MaP: A Rapid and Accessible Protocol for Chemical Mapping of RNA Structures Using Primer-less Sequencing. Invited protocol; under review, 2026. Preprint

[**In review**] **Verma J.** et al. PAN2-PAN3 deadenylase activity is selectively required for mitotic robustness under microtubule stress. Under review, 2026. Preprint

Technical Expertise

AI & ML Model Evaluation: RNA structure-prediction models (EternaFold, RibonanzaNet, RNAfold); RNA foundation models (AIDO.RNA, CodonBERT); mRNA translation-efficiency models (Optimus 5-Prime, RiboNN, UTR-LM); mRNA stability and ribosome-profiling models (Saluki, RiboTIE); benchmarking model predictions against experimental ground truth

Method Development: FAST-MaP (inventor; public web server; Stanford OTL invention disclosure under review); assay design; probe/reagent optimization

Computational Analysis: Python (pandas, NumPy, SciPy, matplotlib, scikit-image); R/Bioconductor; SHAPE data analysis (ShapeMapper2, `cmuts`); biological databases (UniProt, GenBank, RNAcentral, Rfam, Ensembl, PDB, NCBI BLAST, GEO/SRA); reproducible analysis pipelines on GitHub

RNA Biology & Structure Probing: *in vitro* and *in vivo* chemical probing (2A3, DMS); IVT; mRNA translation-efficiency assays; biophysical RNA characterization (mass photometry, dynamic light scattering); RT-qPCR

Molecular & Cellular Biology: CRISPR/Cas9; shRNA/siRNA; cloning; mutagenesis; flow cytometry; mammalian cell culture (HEK293A and other immortalized cell lines); yeast genetics and SGA screens

Sequencing & Library Prep: Illumina sequencing and library preparation; Oxford Nanopore long-read RNA

sequencing; RNA-seq (mammalian and microbial)

Imaging & Microscopy: confocal microscopy; live-cell and time-lapse imaging; high-content screening; quantitative image analysis (ImageJ, ZEN)

Awards

mRNA Research Advancement Award, CELLSCRIPT™ (2026)

mRNA Innovators Award, Eclipsebio (2025)

President's Academic Excellence Initiative PhD Award, University of British Columbia (2021–2023)

Raymond A. Pederson Prize in Physiology, University of British Columbia (2020)

Junior Research Fellowship (CSIR-NET), Government of India (2017)

Teaching and Service

Peer Reviewer: *Science* (AAAS), 2025; *Nature Communications* (Nature Portfolio), 2025 and 2026; *Nature Nanotechnology* (Nature Portfolio), 2025; *Chemistry – A European Journal* (Wiley), 2026

Selected Presentations: FAST-MaP, Stanford RNA Medicine Symposium (poster, 2026); FAST-MaP, Stanford Biochemistry Conference, Santa Cruz (poster, 2026); Salk Cell Cycle Meeting, San Diego (talk, 2023); Gordon Research Conference on Centromeres in Health & Disease, Vermont (talk, 2022)

Mentorship: trained and supervised undergraduate and junior researchers in RNA biochemistry, cloning, and imaging

Education

University of British Columbia — Vancouver, Canada
PhD, Cell and Developmental Biology — 2017–2023

Jawaharlal Nehru Centre for Advanced Scientific Research — Bangalore, India
MS, Molecular Biology and Genetics — 2014–2017

University of Delhi — Delhi, India
BSc, Microbiology — 2011–2014
